A mid-urethral sling (MUS) is a surgical procedure used to treat stress urinary incontinence (SUI) in women. SUI is a condition where physical activities, such as coughing, sneezing, or exercise, cause involuntary leakage of urine due to weakened pelvic floor muscles. The mid-urethral sling procedure involves placing a narrow strip of synthetic mesh under the mid-portion of the urethra to provide support and prevent urine leakage. The sling acts like a hammock, maintaining the urethra in its correct position and preventing involuntary urine loss during activities that increase abdominal pressure. There are different types of mid-urethral slings, such as the transobturator and retropubic approaches, each varying slightly in the placement technique. This procedure is minimally invasive, generally effective, and associated with a high success rate, offering significant improvement in the quality of life for many women with SUI.
