According to our (Global Info Research) latest study, the global Military Image Intensifier market size was valued at USD 633 million in 2023 and is forecast to a readjusted size of USD 1021.9 million by 2030 with a CAGR of 7.1% during review period.

Image enhancement is the basis of night vision and is a complex transformation of energy particles occurring in a vacuum tube. The working principle of the image enhancement system is to collect photons through the objective lens, convert them into electrons through the photocathode, increase the electric energy through the microchannel plate (MCP), use the fluorescent screen to convert the electric energy back to light, and then present the image to be observed through the eyepiece. Precision small power supplies can be used to provide voltage between the components of the vacuum tube for energy conversion and amplification. All the elements in the vacuum tube are closely spaced to avoid electron scattering. Primary electron amplification occurs within the MCP, a thin disk containing millions of tightly spaced channels. As electrons pass through the channel and hit the wall, thousands of other electrons are released. When this hits the screen, the added energy is converted into light thousands of times brighter than the incident light. The fluorescent screen emits this light in the same pattern as the light collected by the objective lens, so that the lightened, enhanced image seen in the eyepiece corresponds to the scene viewed in darkness.

In general, the leading manufacturers of military image intensifiers are L3Harris Technologies, Elbit Systems, Photonis. The top 3 in terms of global market share, with a market share of about 80%.
