## Abstracts

The global Military Microgrid market size is expected to reach \$ 931 million by 2032, rising at a market growth of 4.8% CAGR during the forecast period (2026-2032).

Micro-Grid, also known as microgrid, refers to a small power generation and distribution system composed of distributed power sources, energy storage devices, energy conversion devices, loads, monitoring and protection devices, etc. Microgrid is an autonomous system that can achieve self-control, protection and management. As a complete power system, it relies on its own control and management to supply energy to achieve power balance control, system operation optimization, fault detection and protection, power quality management and other functions. The proposal of microgrid aims to achieve flexible and efficient application of distributed power sources and solve the problem of grid connection of a large number of distributed power sources in various forms. The development and extension of microgrids can fully promote the large-scale access of distributed power sources and renewable energy, realize highly reliable supply of various energy forms to loads, and is an effective way to realize active distribution networks and transition from traditional power grids to smart grids. The power sources in microgrids are mostly distributed power sources with small capacity, that is, small units with power electronic interfaces, including micro gas turbines, fuel cells, photovoltaic cells, small wind turbines, and energy storage devices such as supercapacitors, flywheels and batteries. They are connected to the user side and have the characteristics of low cost, low voltage and low pollution. The so-called microgrid is an independent micro-power system that is mainly based on distributed energy, equipped with energy storage, and realizes intelligent control, forming an integrated distribution, supply and storage system within a certain area. The promotion and application of new energy microgrids will completely change the previous power supply mode of relevant troops that relied solely on diesel generators. Microgrids can provide

safe, reliable, clean and efficient power services for the military. Military microgrids mainly count the application market of microgrids in the military field.

The main market drivers are as follows:

**Global military spending growth:** As global military spending increases, the demand for power supply will also increase accordingly, which provides a broad space for the development of the military microgrid market.

**Development of renewable energy technology:** The advancement of renewable energy technology enables military microgrid systems to adopt more efficient and reliable power generation equipment, thereby improving the overall performance and stability of the system.

**Policy support:** Many countries are promoting the development of green energy and providing policy support for the military microgrid market, which will help further expand the market.

**Safety and reliability requirements:** Military facilities have extremely high requirements for the safety and reliability of power systems, and military microgrid systems can meet these requirements and provide continuous and stable power supply.

**Technical challenges and innovation:** Although military microgrid systems need to face the challenges of stable operation in various extreme environments, this has also promoted technological innovation and progress. Enterprises continue to invest in research and development to improve the reliability and efficiency of the system to meet market demand.
