Abstracts

The global Millimeter-Wave Converter market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The millimeter-wave converter performs two primary functions: frequency conversion and amplification. It takes an input signal, typically at a lower frequency, and converts it to a higher frequency within the millimeter-wave range. The converter may utilize various techniques such as frequency multiplication, frequency mixing, or heterodyne detection to achieve this frequency conversion. Additionally, the converter amplifies the converted millimeter-wave signal to enhance its strength for transmission or further processing.
