Abstracts

According to our (Global Info Research) latest study, the global Millimeter Wave T/R Component market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

Millimeter wave T/R components refer to transmitting (Transmit) and receiving (Receive) components that work in the millimeter wave frequency band (usually the frequency range of 30GHz to 300GHz). It is an important component in modern radar, communication and electronic countermeasure systems, especially in active phased array radar, where millimeter wave T/R components are one of the core components. Millimeter waves have the advantages of narrow beam, wide frequency band, strong anti-interference ability and large capacity, so they are widely used in modern communication and radar systems. T/R is the abbreviation of Transmitter and Receiver, that is, transmitting and receiving components. One end of the millimeter wave T/R component is connected to the antenna, and the other end is connected to the intermediate frequency processing unit, together forming a complete wireless transceiver system.

The main functions of the millimeter wave T/R component include signal transmission, reception, amplification, phase shift, attenuation, etc. It usually includes two branches for transmission and reception, each of which contains a series of complex unit circuits, such as local oscillator, up and down frequency conversion, filter, low noise amplifier, power amplifier, duplex circuit, etc. These unit circuits work together to achieve accurate signal processing and transmission.

This report is a detailed and comprehensive analysis for global Millimeter Wave T/R
