Abstracts

Collapse of the vertebrae due to trauma, osteoporosis or other causes of weakening of the vertebrae is known as vertebral compression fracture (VCF). VCF is more common in people with low bone mass or suffering from osteoporosis. Some of the common symptoms of VCF include, back pain lasting for more than 2-3 weeks, limited spinal mobility, vertebral height loss over time and kyphosis, disability and deformity over a period of time. Vertebral compression fracture is treated primarily with pharmacological therapy and prolonged bed rest. Surgically, VCFs are treated with minimally invasive VCF repair techniques in cases where medicinal therapies fail to cure VCF.

Scope of the Report:

This report studies the Minimally Invasive Vertebral Compression Fracture Repair market status and outlook of Global and major regions, from angles of players, countries, product types and end industries; this report analyzes the top players in global market, and splits the Minimally Invasive Vertebral Compression Fracture Repair market by product type and applications/end industries.

Minimally invasive vertebral compression repair techniques include two procedures, namely, vertebroplasty and balloon kyphoplasty. Both vertebroplasty and kyphoplasty involve injection of medical grade cement in the fractured vertebra. Kyphoplasty is a newer and evolved form of vertebroplasty, where a balloon is inserted in the vertebral body and inflated to restore the original height of the collapsed vertebra and is thereafter followed by cement injection. Vertebroplasty successfully relieves pain and enhances mobility of the patient; while on the other hand, balloon kyphoplasty not only relieves the pain but also restores vertebral height and assists in curing kyphosis.
