## Abstracts

The global Mining Truck Transmissions market size is expected to reach \$ 750 million by 2032, rising at a market growth of 3.8% CAGR during the forecast period (2026-2032).

Mining truck transmissions are core drive units used in mining transport vehicles (such as articulated mining trucks and some rigid mining trucks) for power transmission and torque regulation. They primarily use multi-gear systems and hydraulic torque converters to match speed and traction under different operating conditions, meeting the needs of heavy-duty starts, climbing, and operation in complex terrain. The main types are powershift and automatic transmissions, often employing planetary gear structures to improve load-bearing capacity and reliability. In terms of price, mining truck transmissions vary significantly depending on power rating, typically ranging from \$30,000 to \$150,000 per unit. Mid-to-high power mainstream products are mostly concentrated in the \$50,000 to \$120,000 range, while high-end heavy-duty or customized products may be even more expensive. Overall, they belong to the mid-to-high value components of engineering machinery transmission systems. Demand is projected to exceed 7,000 units by 2025.

This report studies the global Mining Truck Transmissions production, demand, key manufacturers, and key regions.
