## Abstracts

The global miRNA Inhibitor market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

miRNA inhibitor is a specially designed oligonucleotide molecule that can bind to miRNA and interfere with its natural function, thereby downregulating the expression of target miRNA. miRNA is a type of small molecule RNA with a length of approximately 22 nucleotides, widely present in eukaryotic cells and capable of regulating gene expression through interactions with targeted mRNA. miRNA plays an important regulatory role in normal biological processes. However, when the expression of certain miRNAs is abnormal or excessive, it can lead to the emergence and development of many diseases (such as cancer, cardiovascular disease, etc.). Therefore, the regulation and intervention of miRNA has become one of the current research hotspots. miRNA inhibitors are an artificial intervention method targeting miRNA. miRNA inhibitors and miRNAs have complementary pairing characteristics, which can specifically bind to the target miRNA and prevent the interaction between miRNA and mRNA, thereby downregulating the expression of the target miRNA. The design of miRNA inhibitors usually uses chemical synthesis techniques, which can optimize their stability, specificity, and biological activity by changing the sequence of the inhibitor, chemical modification, and other methods. The use of miRNA inhibitors can effectively regulate the expression of miRNA. In vitro experiments, after intervention with miRNA inhibitors, the expression level of target miRNAs in cells will significantly decrease, while the corresponding mRNA expression level will also increase. In addition, miRNA inhibitors can also be used for the study and validation of miRNA function, providing important tools for the study of miRNA related mechanisms. miRNA inhibitors are specially designed molecules that can downregulate the expression of target miRNAs by binding to miRNAs and interfering with their natural functions. The use of miRNA inhibitors is an

effective means of miRNA intervention, which is of great significance for the regulation and intervention of miRNA.
