The anti mixing valve has two seats in the valve to allow fluid separation. In case of leakage, there is an outlet area between the two seats, which is a positive method to prevent mutual contamination of two different fluids. The anti mixing valve has two independent plug seals to isolate the fluid, and the space between the seals forms a leakage chamber under atmospheric pressure. Unusual leakage of anti mixing valve; However, if a leak does occur, the product will flow into the leakage chamber and leave through the bottom outlet, making it easier to detect. When the valve is open, the leakage chamber is closed. Then the product flows from one production line to another. The design of two independent control valve stems of the anti mixing valve helps to ensure that two different products cannot be mixed. This makes the anti mixing valve an ideal choice for large-scale food, beverage, dairy products and other high-purity manufacturing facilities that produce multiple products at the same time.
