Abstracts

According to our (Global Info Research) latest study, the global MLCC Media Powder Materials market size was valued at US\$ 130 million in 2025 and is forecast to a readjusted size of US\$ 217 million by 2032 with a CAGR of 6.2% during review period.

MLCC Media Powder Materials refer to the fine ceramic dielectric powders used to produce the dielectric layers of Multilayer Ceramic Capacitors (MLCCs). These powders are typically based on high-purity barium titanate (BaTiO₃) and are precisely engineered through doping, particle size control (often sub-micron to nano scale), and surface modification to achieve stable capacitance, high dielectric constant, low loss, and reliable performance across temperature and voltage ranges. During MLCC manufacturing, the powder is dispersed into a slurry, cast into ultra-thin ceramic sheets, stacked with internal electrodes, and co-fired to form hundreds of dielectric layers. As electronic devices move toward miniaturization, high frequency operation, and high power density?such as smartphones, automotive electronics, and AI servers?the quality and consistency of dielectric powder materials become critical to capacitor performance and reliability. In 2025, global MLCC Media Powder Materials production reached approximately 49700 tons, with an average global market price of around 2535 USD/ton. The production capacity for MLCC Media Powder Materials in 2025 was approximately 50000 tons . The typical gross profit margin for MLCC Media Powder Materials between 20% and 40%.
