Abstracts

According to our (Global Info Research) latest study, the global Mobile Environmentally Friendly Hopper market size was valued at US\$ 276 million in 2025 and is forecast to a readjusted size of US\$ 406 million by 2032 with a CAGR of 5.7% during review period.

In 2025, global sales of mobile environmentally friendly material hoppers reached 1,850 units, with an average selling price of US\$145,000 per unit. Mobile environmentally friendly material hoppers are industrial environmental protection equipment used for loading, unloading, and temporary storage of bulk materials. They are typically installed in ports, mines, building material factories, and logistics transfer stations to collect and evenly transport bulk materials unloaded by grabs or loading/unloading equipment to trucks, conveyor belts, or warehousing systems. Simultaneously, they reduce dust pollution through dust collection and sealing structures. Essentially, mobile environmentally friendly material hoppers are receiving devices in bulk material conveying systems. They achieve stable material discharge through a large-capacity hopper structure and a bottom-controlled unloading device. They can be equipped with bag filters, water mist dust suppression systems, and sealing baffles to reduce dust emissions. Common volumes are approximately 20-150 m³, and unloading capacities are approximately 300-3200 t/h. The upstream raw materials mainly include structural steel (Q345 steel plate), hydraulic systems, motors, electrical control systems, dust collector filter bags, and wear-resistant liners. Downstream suppliers are primarily port bulk cargo terminals, mining companies, cement plants, grain ports, and coal logistics companies. In 2025, the global total production capacity of mobile environmentally friendly hoppers was approximately 2,600 units per year, with an average gross profit margin of about 23%. From a demand and opportunity perspective, with the growth of port bulk cargo throughput and stricter environmental regulations, traditional open

unloading systems are gradually being replaced by environmentally friendly hoppers with dust collection systems. Demand is particularly strong in coal, ore, cement clinker, and grain loading and unloading scenarios. Simultaneously, equipment is being upgraded towards modularity, automation, and high-efficiency dust removal. In the future, there is still significant room for development in green port construction, intelligent mining loading and unloading, and bulk logistics upgrades.
