## Abstracts

According to our (Global Info Research) latest study, the global Mobile Medication Management System market size was valued at US\$ 557 million in 2025 and is forecast to a readjusted size of US\$ 905 million by 2032 with a CAGR of 7.3% during review period.

A Mobile Medication Management System (MMMS) is a drug management solution that combines mobile technologies (such as apps and mobile devices) with a back-end system to enable digital, automated, and end-to-end tracking of drugs in medical institutions (especially for narcotic drugs and high-risk drugs). It can achieve full lifecycle management of drugs from warehousing, dispensing, inventory counting to patient use, improving efficiency and ensuring safety.

The upstream of a surgery information management system mainly consists of IT infrastructure and general-purpose technologies, including servers and storage equipment, network and information security hardware, databases and operating systems, cloud platforms, and healthcare data standards and compliance-related technologies. This segment provides the foundation for system stability, data security, and scalability, while product differentiation at this level is relatively limited. The downstream segment represents the core area of value creation and primarily includes hospitals and medical institutions, especially large general hospitals, tertiary hospitals, regional medical centers, and specialized hospitals with high surgical volumes and complex management needs. Downstream applications cover surgical scheduling and operating room resource management, preoperative assessment and approval, intraoperative data recording and multidisciplinary collaboration, postoperative follow-up and quality tracking, as well as performance and cost analysis. These functions directly

affect operating room utilization, clinical coordination efficiency, patient safety, and overall hospital operational performance. With the trend toward refined and group-based hospital management, downstream users place increasing emphasis on deep interoperability with HIS, EMR, anesthesia systems, and materials management platforms, as well as the ability to support multi-campus, multi-specialty, and high-throughput surgical environments.

In terms of development trends, surgery information management systems are steadily evolving toward greater digitalization, platform-based architectures, and intelligent capabilities. Cloud deployment, mobile access, data visualization, and unified data platforms are becoming mainstream, with growing adoption of data analytics and intelligent algorithms for resource forecasting, scheduling optimization, and quality management. Key demand drivers include the long-term growth in surgical volumes, increasing pressure on medical resources, heightened focus on cost control and risk management by hospitals, and continuous policy support for healthcare informatization, surgical quality management, and data traceability. Constraints mainly arise from the complexity of legacy hospital IT systems, the difficulty and cost of system integration and transformation, long implementation cycles, and the time required for clinical staff to adapt to digital workflows. Rising data security and privacy compliance requirements also add to implementation and operational complexity. From a profitability perspective, revenue is primarily generated through software licensing, project implementation, and ongoing maintenance services.
