Abstracts

The global Mobile Phone Flash Memory Chip market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Following a strong growth of 26.2 percent in the year 2021, WSTS revised it down to a single digit growth for the worldwide semiconductor market in 2022 with a total size of US\$580 billion, up 4.4 percent. WSTS lowered growth estimation as inflation rises and end markets seeing weaker demand, especially those exposed to consumer spending. While some major categories are still double-digit year-over-year growth in 2022, led by Analog with 20.8 percent, Sensors with 16.3 percent, and Logic with 14.5 percent growth. Memory declined with 12.6 percent year over year. In 2022, all geographical regions showed double-digit growth except Asia Pacific. The largest region, Asia Pacific, declined 2.0 percent. Sales in the Americas were US\$142.1 billion, up 17.0% year-on-year, sales in Europe were US\$53.8 billion, up 12.6% year-on-year, and sales in Japan were US\$48.1 billion, up 10.0% year-on-year. However, sales in the largest Asia-Pacific region were US\$336.2 billion, down 2.0% year-on-year.

Currently, there are two main types of flash memory for mobile phones and other mobile products on the market: eMMC and UFS. The full name of eMMC is 'embedded Multi Media Card', which is an embedded multimedia memory card. eMMC packages a NAND Flash chip and a control chip together to meet the needs of storage hardware with high capacity, high stability and high read and write speed. It is more in line with the development trend of thin and compact application appearance. Manufacturers only need to purchase Hongwang Semiconductor eMMC chips and put them into new machines. They do not need to deal with other complicated NAND Flash compatibility and management issues, which can reduce the time to market and research and development costs, and accelerate the speed of new products.
