Abstracts

Mobile runtime application self-protection is a security technology, which is used as an application and can detect as well as prevent real-time external threats without human intervention. It embeds security into already running application and intercepts every call to the host system to ensure its security. It offers detailed view on the activities that are running in the system to improvise the security accuracy. However, the mobile RASP application can only protect individual application, which mandates its separate installation for each application running on the device.
