## Abstracts

According to our (Global Info Research) latest study, the global Model Real-Time Operation and Maintenance System market size was valued at US\$ 2110 million in 2025 and is forecast to a readjusted size of US\$ 7464 million by 2032 with a CAGR of 19.8% during review period.

The model real-time operation and maintenance system refers to a solution based on digital technology and data analysis, which is designed to monitor, manage and optimize the real-time operation of machine learning models. Through real-time data collection, model monitoring and automated operation and maintenance functions, the system ensures the stability, performance and accuracy of machine learning models in production environments, thereby achieving continuous model effect monitoring, iterative optimization and intelligent decision support.

The industry chain of real-time model operation and maintenance systems can be summarized as 'upstream infrastructure and data ? midstream platforms and tools ? downstream industry applications and services': The upstream mainly includes computing power and cloud infrastructure (public cloud/private cloud, GPU/CPU, containers and Kubernetes), data collection and storage (data middleware, streaming data platform, logs and monitoring data), and basic software (operating system, database, middleware); The midstream is the core value link, consisting of real-time model operation and maintenance platform and tool vendors, providing capabilities such as model deployment and version management, online inference services, performance and drift monitoring, automatic alarms, canary deployment/rollback, A/B testing, automatic scaling and scaling, and security compliance, usually delivered in the form of software licensing or SaaS subscription; Downstream applications cover scenarios such

as financial risk control, internet recommendation and advertising, intelligent manufacturing, smart energy, smart transportation, and medical AI, and extend to system integrators and consulting service providers for industry-specific implementation. In terms of profitability, the gross profit margin of upstream hardware and basic cloud services is relatively low (about 20%–40%), while the gross profit margin of midstream real-time operation and maintenance software/platform is the highest, with mature vendors generally at 60%–80%, and even higher for those with a high degree of SaaS adoption. The gross profit margin of downstream industry solutions and system integration is in the middle, usually at 30%–50%. The overall industry chain shows a structural characteristic of 'high gross profit margin for platform software and relatively low gross profit margin for hardware and integration'.

The emergence of the real-time model operation and maintenance system marks the popularization and deepening of machine learning models in practical applications. This system not only simplifies the deployment and management process of the model, but more importantly, it provides real-time monitoring and automatic adjustment functions, allowing the model to run continuously and stably in the production environment. By promptly discovering and solving problems in the operation of the model, the efficiency and accuracy of the model are improved, providing reliable support for the company's data-driven decision-making. With the continuous development and improvement of the real-time model operation and maintenance system, it will further promote the widespread application of machine learning technology in various industries, helping companies achieve digital transformation and business growth.
