According to our (Global Info Research) latest study, the global Modified LCP Engineering Plastics market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Liquid Crystal Polymer (LCP) is a new type of polymer material. Liquid crystal polymer is an intermediate phase polymer between crystal and liquid. After being heated and melted or dissolved by a solvent, it will change from rigid fixation to a fluid liquid substance while maintaining the orientation of the crystalline substance. Order, thereby forming a liquid crystal state that has both liquid fluidity and orderly arrangement of crystalline molecules. From the perspective of molecular structure, LCP has a rigid rod-shaped molecular chain structure. The molecular chains can be arranged in a high degree of orientation, the structure is tightly packed, and the force between macromolecules is relatively large. Therefore, compared with other organic polymer materials, LCP exhibits excellent properties such as high temperature resistance, high strength mechanical properties, superior electrical properties and processing properties.
