According to our (Global Info Research) latest study, the global Modular Active Vibration Isolation Platform market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A modular active vibration isolation platform is a specialized system used to mitigate or eliminate the effects of vibrations on sensitive equipment or instruments. It is designed to provide a stable and isolated working platform, free from external vibrations, in order to ensure the accuracy, reliability, and performance of the equipment. The platform consists of multiple modular units that work together to isolate vibrations. Each unit typically includes an active control system, sensors, actuators, and a robust mechanical structure. These components work in synergy to detect vibrations and then actively counteract them in real-time. The active control system continuously measures the vibrations using sensors and sends feedback to the actuators. The actuators respond by generating forces or motions that are precisely controlled to counteract the incoming vibrations. This feedback loop happens at a high frequency and is capable of effectively reducing or eliminating vibrations across a wide range of frequencies.
