Moisture retaining agent for meat products refer to a type of additives specially designed to be used in meat products to effectively maintain their moisture content. This type of additive enhances the water-holding capacity of meat through specific chemical or physical mechanisms, such as changing the pH value of the meat, increasing ionic strength, or affecting the structure of the protein. In the processing of meat products, the use of moisture retaining agents is crucial. It not only ensures that the product retains moisture during processing, storage and sales, but also maintains the tenderness, taste and nutritional value of the meat. Common moisture retaining agents for meat products include phosphate compounds, which can bind to the protein in the meat and release polar groups, which in turn combine with water molecules to improve the water-holding capacity of the meat. In addition, these additives help improve the texture and appearance of meat products, extending their shelf life.
