Abstracts

A molded transformer is a transformer in which the winding section is impregnated and molded with epoxy or other resin. It is also called a dry-type transformer. When a transformer changes voltage, the iron core and windings heat up due to power loss in the transformer, so it is necessary to dissipate the heat. While oil is used to dissipate heat in general transformers, molded transformers do not use oil, making them superior in terms of safety against ignition and other hazards.

Because of their low risk of ignition in the event of an accident and their lightweight and small size, they are suitable for indoor use and are installed in buildings.

According to our (Global Info Research) latest study, the global Molded Transformer market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
