The MBE crucible is a special type of crucible used in the material growth process in molecular beam epitaxy technology. The MBE is a high-vacuum technique used to prepare thin films of single-crystal materials, often used in the manufacture of semiconductor devices and optoelectronic devices.

The MBE crucible has the characteristics of high vacuum environment, heating function, good thermal uniformity and substrate support. The MBE crucible is a key component in MBE technology, used to accommodate material sources, supply evaporated materials, control growth conditions, etc. By precisely controlling the parameters inside the crucible, such as temperature, pressure, and evaporation rate, etc., high-quality, precisely controlled film growth can be achieved.
