Abstracts

The global Molybdenum-100 market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Radioisotopes are the unstable form of an element that emit radiation to transform into a more stable form. Radiation is easily traceable and can cause changes in the substance it falls upon. These special attributes make radioisotopes useful in medicine, industry and other areas. Most radioisotopes are artificially produced in research reactors and accelerators by exposing a target material to “intense particles,” such as neutrons or protons, followed by different chemical processes to bring them into the required chemical form.

Molybdenum isotopes have many medical uses. For instance, Mo98 and Mo100 are used for new uranium-free production methods of 99mTc, radioisotope used in 80% of nuclear medicine procedures. These applications require a high enrichment level, a very high chemical purity and a secure and stable supply chain.

This report studies the global Molybdenum-100 production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Molybdenum-100, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2023 as the base year.
