According to our (Global Info Research) latest study, the global Molybdenum Aluminum Chromium Alloy market size was valued at US\$ 24.61 million in 2025 and is forecast to a readjusted size of US\$ 53.88 million by 2032 with a CAGR of 8.9% during review period.

Molybdenum-aluminum-chromium alloys (MAC-chromium alloys) are intermediate or special alloy materials with aluminum, molybdenum, and chromium as their main components. They are commonly used as alloying additives in titanium alloys, nickel-based alloys, high-temperature alloys, and other high-performance metallic materials. These alloys can stably introduce aluminum, molybdenum, and chromium into the matrix material during the smelting process. Aluminum helps reduce density, improve oxidation resistance, and form strengthening phases; molybdenum improves the material's high-temperature strength, corrosion resistance, and creep resistance; and chromium enhances oxidation resistance, heat resistance, and corrosion resistance. Therefore, MAC-chromium alloys are widely used in aerospace, military, energy equipment, chemical equipment, gas turbines, and high-end titanium alloy manufacturing, and are important alloying additives for preparing high-temperature, high-strength, and corrosion-resistant alloy materials. Global sales in 2025 were approximately 476 tons.
