Abstracts

According to our (Global Info Research) latest study, the global Molybdenum-Based Binary Alloys market size was valued at US\$ 799 million in 2025 and is forecast to a readjusted size of US\$ 1536 million by 2032 with a CAGR of 9.6% during review period.

Molybdenum-based binary alloys are binary alloy materials formed by using molybdenum (Mo) as the base element and adding another main alloying element. Examples include molybdenum-aluminum alloys, molybdenum-rhenium alloys, molybdenum-titanium alloys, molybdenum-zirconium alloys, and molybdenum-niobium alloys. Because molybdenum itself possesses a high melting point, high strength, good thermal and electrical conductivity, and good high-temperature stability, adding another alloying element can further improve its high-temperature strength, creep resistance, toughness, oxidation resistance, corrosion resistance, and processing performance. Molybdenum-based binary alloys are commonly used in aerospace, electronics, semiconductors, vacuum furnaces, high-temperature structural components, nuclear industry, glass melting electrodes, and special equipment, and belong to an important branch of high-temperature refractory metal materials. Sales in 2025 were approximately 14,000 tons.
