Abstracts

The global Molybdenum Carbide NanoPowder market size is expected to reach $ 439 million by 2032, rising at a market growth of 4.9% CAGR during the forecast period (2026-2032).

Molybdenum carbide (MoC) powder is a high-melting-point hard compound powder formed from molybdenum and carbon, primarily including Mo?C and MoC crystal forms. It possesses high hardness, high thermal stability, good wear resistance, corrosion resistance, and excellent catalytic activity, while also exhibiting certain electrical conductivity. It is widely used in cemented carbide, wear-resistant materials, catalysts, electronic materials, and advanced ceramics.

Upstream applications mainly include molybdenum powder, molybdenum oxide, molybdates, carbon black, graphite, and other carbon sources, as well as industrial gases and energy sources. Downstream applications primarily include cemented carbide, cutting tools, wear-resistant coatings, petrochemical catalysis, hydrogen catalysis, electrochemical materials, advanced ceramics, electronic materials, and high-temperature structural materials.

The global average price of molybdenum carbide powder is approximately US$80,000 per ton, with sales volume of approximately 3,600–4,400 tons and an industry gross profit margin of 18%.

The future global molybdenum carbide powder market will develop towards higher purity, ultrafine particles, nano-sized particles, and functionalized products. With the increasing demands for material performance from high-end cemented carbide, precision cutting tools, wear-resistant coatings, and advanced ceramics, the demand for

molybdenum carbide powder with uniform particle size, low impurity content, and controllable crystal phase will continue to rise. Meanwhile, molybdenum carbide has significant application potential in hydrogenation reactions, hydrogen evolution reactions, carbon dioxide conversion, and new energy catalysis, which will drive its expansion from traditional wear-resistant materials to functional materials. In the future, companies will place greater emphasis on low-temperature synthesis, carbothermal reduction, plasma, and nanotechnology to enhance their competitiveness in high-end application markets by reducing energy consumption, improving product consistency, and developing customized powders.
