According to our (Global Info Research) latest study, the global Molybdenum Evaporation Boat market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Thermal evaporation (resistance evaporation) is a coating method employed during physical vapor deposition. The material that is to form the subsequent layer is heated in a vacuum chamber until it evaporates. The vapor formed by the material condenses on the substrate and forms the required layer. Molybdenum boats share properties with their source material, either pure molybdenum or molybdenum alloy. These are formed from processed molybdenum plates that have undergone cutting, folding, riveting, and/or welding.
