Abstracts

According to our (Global Info Research) latest study, the global Monobromobenzene market size was valued at US\$ 43.63 million in 2025 and is forecast to a readjusted size of US\$ 59.58 million by 2032 with a CAGR of 4.3% during review period.

Monobromobenzene is a monobrominated aromatic hydrocarbon with the molecular formula C_6H_5Br and CAS number 108-86-1. It is a clear, colorless to pale-yellow liquid at room temperature, with major industrial grades comprising purity $\geq 99.0\%$ and purity $\geq 99.5\%$, together with additional controls on moisture, free bromine, residual benzene, and dibromobenzene impurities according to downstream process requirements. It is generally produced by reacting benzene with liquid bromine in the presence of an iron-based catalyst, followed by neutralization, washing, dehydration, and distillation. Key upstream inputs include benzene, liquid bromine, catalysts, caustic soda, utilities, and packaging materials, while major downstream customers include manufacturers of Grignard reagents, pharmaceutical intermediates, agrochemical intermediates, and fine chemicals. Based on producer ex-factory prices, global effective nameplate capacity in 2025 is estimated at approximately 14,680 metric tons, with actual sales volume of about 8,742 metric tons, an average ex-factory price of approximately USD 4.85 per kilogram, and typical producer gross margins of approximately 18%-26%.

The global monobromobenzene market has entered a mature stage, with well-established manufacturing processes and relatively standardized product specifications. Competition is primarily based on raw-material sourcing, production costs, product purity, impurity control, supply reliability, and customer qualification. Industrial supply is concentrated mainly in India and China. India benefits from a well-developed bromine chemistry, pharmaceutical intermediate, and agrochemical intermediate ecosystem,

while China is supported by access to benzene and liquid bromine, a broad fine-chemical manufacturing base, and substantial domestic demand. Europe, North America, and Japan mainly serve as downstream consumption, import, and distribution markets, with relatively limited additions of industrial capacity, and the global supply chain is expected to remain concentrated in Asia.

From the demand side, Grignard reagents, pharmaceutical intermediates, agrochemical intermediates, and other fine-chemical synthesis applications represent the principal consumption areas. Grignard chemistry and general organic synthesis provide a relatively stable demand base, while pharmaceutical and agrochemical demand is more sensitive to product commercialization, regulatory approvals, patent cycles, customer inventories, and campaign-production schedules. As pharmaceutical and agrochemical intermediate manufacturing becomes increasingly specialized and outsourced, downstream customers are placing greater emphasis on product purity, low moisture, batch consistency, and customized impurity control. Demand for higher-purity and customized grades is therefore expected to grow faster than demand for conventional industrial material.

Manufacturing improvements will focus on closed charging systems, automated process control, improved reaction selectivity, off-gas treatment, hydrogen bromide by-product recovery, energy-efficient distillation, and reduced bromide-containing wastewater generation. Because the market for monobromobenzene alone is relatively limited, producers are more likely to develop multipurpose facilities capable of manufacturing a range of aromatic bromides rather than dedicated single-product plants. Flexible product switching, higher equipment utilization, and improved by-product recovery can reduce unit production costs. Manufacturers with reliable bromine procurement, compliant environmental facilities, multiproduct production capabilities, and stable long-term customers will retain stronger advantages in cost control, delivery performance, and profitability.

The monobromobenzene market is expected to maintain moderate growth, although volatility in bromine and benzene prices, hazardous-material transportation restrictions, rising environmental and safety expenditure, and fluctuations in downstream project demand will continue to constrain expansion. Alternative routes involving boronic acids and boronate esters, chlorinated aromatics, direct C-H functionalization, and pre-manufactured organometallic reagents may reduce monobromobenzene consumption in selected applications. However, catalyst costs, substrate compatibility, reaction yields, and industrial scale-up limitations are likely to prevent broad substitution over the medium term. As regulatory requirements and customer audits become more stringent,

smaller suppliers lacking stable quality control and compliant production facilities will face increasing pressure, leading to a gradual concentration of the market toward more specialized, integrated, and standardized manufacturers.
