Monoclonal antibodies for primary hypercholesterolemia are a class of monoclonal antibody drugs that target proprotein convertase subtilis subtilis /kexin 9 (PCSK9). By specifically binding to PCSK9, they prevent its binding to the low-density lipoprotein receptor (LDL-R), thereby reducing the degradation of LDL-R, increasing the clearance of LDL-C, and significantly reducing the level of low-density lipoprotein cholesterol (LDL-C) in the blood. These agents are used primarily to treat adult patients with primary hypercholesterolemia, including heterozygous familial hypercholesterolemia and nonfamilial hypercholesterolemia, and mixed dyslipidemia.
