## Abstracts

According to Mendel's Laws, the monogenetic disorders are inherited because of a single defective gene on the autosomes. The monogenic disorders are caused by single mutated gene which can be present on single or both chromosomes. Females and males are equally affected by this disorder due to the conditions on the autosomes. Some of the tests are available for the mainstream of the common monogenic disorders such as Cystic fibrosis, sickle cell anemia, SCID, Tay-sachs disease, polycystic kidney disorder, Gaucher's disease, Huntington's disease, neurofibromatosis, thalassaemia and familial hypercholesterolemia. There are several test performed to treat with the monogenic disorders such as diagnostic testing, carrier testing, predictive & pre-symptomatic testing, prenatal testing and new-born screening.
