According to our (Global Info Research) latest study, the global Monomer Polyether market size was valued at US\$ 2952 million in 2025 and is forecast to a readjusted size of US\$ 3664 million by 2032 with a CAGR of 3.2% during review period.

Monomer polyether is an oligomer with an ether bond (- R-O-R -) in the main chain and more than 2 hydroxyl groups (- OH) in the end or side groups. Its structural characteristics endow it with high reactivity, excellent physical and chemical properties, as well as unique solubility and dispersibility. The synthesis of monomeric polyether mainly uses three types of raw materials, including organic oxides (such as propylene oxide, ethylene oxide, etc.), furan cyclic compounds (such as tetrahydrofuran), and initiators (such as polyols such as sorbitol, sucrose, pentaerythritol, glycerol, etc.). In addition, catalysts are needed to promote the progress of the reaction. The synthesis process usually includes steps such as raw material pretreatment, ring opening polymerization reaction, and post-treatment procedures.
