Abstracts

The monopolar radio frequency knife is a new type of surgical instrument. Its working principle is that radio frequency energy in the form of bipolar forms a small plasma electric field in an electrolyte solution or gel such as normal saline, and the ions are accelerated by the electric field to obtain sufficient energy. Then, the energy is transmitted to the tissue, and the molecular bonds of the tissue in the electric field are broken at a low temperature of 40°C to 70°C, the ionic bonds of the protein are destroyed, and the coagulation is performed to obtain the effect of cutting, hemostasis or ablation.
