Abstracts

The global Motor for Nuclear Power Plant Feedwater Pump market size is expected to reach \$ 1860 million by 2032, rising at a market growth of 6.6% CAGR during the forecast period (2026-2032).

In 2025, global sales of motors for nuclear power plant feedwater pumps reached 12,500 units, with an average selling price of \$92,000 per unit. Global production capacity stands at approximately 15,000 units per year, and the industry's average gross profit margin is around 38%. These motors are specialized, highly reliable units designed to drive feedwater pumps within the secondary circuit of nuclear power plants; they typically feature high-insulation-class windings, radiation-resistant materials, and redundant cooling designs to meet nuclear safety standards and requirements for long-cycle continuous operation. Their core function is to provide stable power output to feedwater pumps under high-temperature and high-pressure conditions, ensuring the safe operation of the steam generator feedwater system and maintaining the reactor's thermal-hydraulic balance. Upstream inputs primarily include electrical steel (silicon steel sheets), copper, insulating resins, bearing steel, and forgings, while downstream supply relationships are concentrated among integrators of major nuclear island equipment and manufacturers of nuclear-grade pumps. Future development trends focus on high efficiency and low loss, intelligent condition monitoring, and extended service life through enhanced radiation resistance. Consumption of upstream materials is rising in tandem with new nuclear capacity additions and life-extension retrofits; demand growth is driven by nuclear power expansion, the refurbishment of aging units, and the development of emerging overseas nuclear markets, with business opportunities centered on the domestic substitution of high-end nuclear-grade motors and the upgrading of products for greater longevity and reliability.
