Abstracts

The global Motor Digital Servo Press market size is expected to reach \$ 1879 million by 2032, rising at a market growth of 4.8% CAGR during the forecast period (2026-2032).

In 2025, global Motor Digital Servo Press production reached approximately 73,497 Units. The average price is approximately \$18,000. Motor Digital Servo Press is a high-precision pressure processing or assembly equipment that uses a motor (usually a servo motor) as the core drive source and achieves closed-loop control of parameters such as pressure, position, speed and time through a digital control system.

Gross Profit Margin Level

From a profit structure perspective, electric digital servo presses belong to high-value-added mechatronic equipment. Their value comes not only from the frame and actuator, but also from the servo motor, lead screw/transmission mechanism, force sensor, displacement feedback, controller, process software, curve monitoring and traceability module, and integration capabilities with automated production lines. Publicly available companies typically do not disclose the gross profit margin of this product line separately. However, considering the product configurations and functional complexity publicly demonstrated by companies such as TOX, Promess, Kistler, ESTIC, and Bosch Rexroth, the gross profit margin of standardized small-to-medium tonnage electric servo presses is generally higher than that of traditional pneumatic/hydraulic single machines. Customized large-tonnage forming servo presses, on the other hand, have relatively moderate gross profit margins due to higher frame, delivery, and project-based costs. Overall, the industry mainstream level is roughly in the range of 28%?35%, with standardized press-fitting leading products reaching 30%?40%, while large stamping/forming projects are typically closer to 20%?30%.

Industry Drivers

The core driving force of this industry stems primarily from the manufacturing sector's demand for upgraded press-fitting and forming processes that offer high precision, traceability, and low energy consumption. Compared to traditional pneumatic, hydraulic, and conventional mechanical presses, motor-driven digital servo presses offer superior closed-loop control of position, speed, and pressure. They can record press-fitting results, force-displacement curves, and process windows in real time, significantly reducing defect rates and meeting increasingly stringent process quality requirements in industries such as automotive, electronics, and medical. Simultaneously, the growth in new energy vehicles, batteries, motors, connectors, lightweight body parts, and high-strength steel/aluminum sheet forming is also driving demand for more flexible and programmable servo presses. Another crucial factor is Industry 4.0 transformation: More and more users desire equipment that can be connected to production lines via bus, OPC UA, or software platforms to enable parameter calling, process tracking, remote diagnostics, and accelerated changeover. This makes 'digital servo presses' more valuable than simply 'presses with servo motors.'
