Abstracts

The motor drive timer is composed of a small motor, usually a synchronous motor. The gear mechanism is controlled with the help of an electrically operated clutch. The gear mechanism can reduce the speed of the motor to the required lower speed value, so the motor can rotate the contact through the gear mechanism. Trigger the lever. After the trigger lever rotates a certain preset distance, the timer contact action is operated. The delay time of the contact action can be changed by the knob. Turn the knob to change the distance between the trigger lever and the contact.
