## Abstracts

The global Motor Sailplanes market size is expected to reach \$ 776 million by 2032, rising at a market growth of 7.8% CAGR during the forecast period (2026-2032).

A Motor Sailplane is a high-performance aircraft designed primarily for soaring, equipped with an integrated propulsion system—typically a retractable engine and propeller—that allows it to take off and climb to soaring altitude without the need for a tow plane or winch. Unlike Touring Motor Gliders (TMG), which resemble traditional airplanes, a motor sailplane maintains the extremely long, slender wings and aerodynamic purity of a pure racing sailplane. Once the desired altitude is reached, the engine is shut down and retracted into the fuselage, allowing the pilot to pursue long-distance cross-country flights using only thermal or ridge lift. In the event of losing lift, the engine can be 're-started' in flight (often called a 'sustainer' or 'turbo' configuration) to avoid an off-field landing.

In 2025, global Small Electric Glider production reached approximately 3000 units, and average price was 150000 usd/unit.

This report studies the global Motor Sailplanes production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Motor Sailplanes and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2025 as the base year. This report explores demand trends and competition, as well as details the characteristics of Motor Sailplanes that contribute to its increasing demand across many markets.
