Abstracts

The global Motor Winding Machine market size is expected to reach \$ 710 million by 2032, rising at a market growth of 9.4% CAGR during the forecast period (2026-2032).

In 2025, global Motor Winding Machine production reached approximately 18.4 k units with an average global market price of around k US\$20 per unit. A motor winding machine is a precision mechatronic system that positions and tensions conductive wire into the slots of a motor's stator or rotor core according to programmed layer and pitch sequences. Fully automated motor winding equipment eliminates cycle-to-cycle variability in tension, placement, and crossover geometry, directly reducing copper waste and electrical asymmetry across production batches. By integrating multi-axis synchronized motion, real-time tension feedback, and automated termination processing, the machine achieves higher slot fill factors and consistent inter-turn insulation integrity. This capability minimizes localized hotspots and premature insulation failure, while increasing output per operator without compromising electrical performance consistency.

From the perspective of corporate revenue and profit, the Motor Winding Machine will undergo a deep transformation towards full automation and intelligence in the future. The Motor Winding Machine has evolved from semi-automatic to fully automatic, realizing the automatic production of complex coils through computer program control, which significantly reduces manual intervention and lowers production costs, directly enhancing corporate profits. Future equipment will integrate more sensors and intelligent control technologies to achieve real-time monitoring and fault warning of equipment status, thereby further improving production efficiency and equipment lifespan and enhancing market competitiveness. As the electronics, electrical appliances, and new energy motor industries impose higher requirements on product

precision, industry development trends will focus on customization, requiring equipment to possess higher flexibility to quickly adjust parameters and meet the diverse demands for coil shapes and specifications across different industries, thus expanding into high value-added markets. Furthermore, to meet the needs of design and manufacturing for specific purposes, products such as brushless DC motors are diversifying, which will also drive the continuous evolution of Motor Winding Machine technology towards specialization and non-standard customization.
