Abstracts

Most motorcycles work on a 12-volt battery, which is made up of a plastic case containing six cells. Each cell is made up of a combination of positive and negative plates dipped in a dilute sulfuric acid solution called an electrolyte. Each cell within this setup has a voltage of around 2.1 volts when fully charged.

Scope of the Report:

This report focuses on the Motorcycle Batteries in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

The preference for lithium-ion batteries is increasing because it has a high resistance to self-discharge. Lithium-ion batteries can hold the charge for several months as their self-discharging is ten times lower in comparison to the self-discharge of standard lead-acid batteries.

Lead-acid batteries lose its efficiency over a period due to the formation of sulfates, which is resulted from the immersion of lead plates in the sulfuric acid.

The worldwide market for Motorcycle Batteries is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
