Abstracts

According to our (Global Info Research) latest study, the global Motorcycle Variable-speed V-belt market size was valued at US\$ 190 million in 2025 and is forecast to a readjusted size of US\$ 263 million by 2032 with a CAGR of 4.8% during review period.

In 2025, global sales of Motorcycle Variable-speed V-belt reached 485 million meters, with an average selling price of \$0.38 per meter. Total global production capacity stood at approximately 560 million meters, and the industry's overall gross profit margin was around 29%. These V-belts' flexible transmission components used in scooters and certain small-displacement Continuously Variable Transmission (CVT) systems facilitate the continuous, stepless transfer of engine power between the drive and driven pulleys through a composite structure of a rubber matrix and high-strength fiber reinforcement. Operating via frictional transmission to achieve torque multiplication and variable speed functions, they serve as the core power transmission elements of CVT systems, directly influencing vehicle acceleration, transmission efficiency, and service life. Upstream raw materials primarily include neoprene or EPDM rubber, polyester or aramid reinforcement cords, carcass materials, and vulcanization additives; midstream processes involve rubber compounding, winding/forming, vulcanization/curing, and grinding; and downstream supply chains encompass motorcycle OEMs, Tier 1 suppliers of engines and CVT systems, and the aftermarket. Future development will focus on highly wear-resistant, long-life composite materials, low-noise and high-efficiency transmission structures, and adaptations for electric and hybrid motorcycle CVTs. Demand growth is driven by the expanding motorcycle populations in Southeast Asia and India, the need for urban commuting solutions, and shortened aftermarket replacement cycles, with business opportunities concentrated in the upgrading of durable CVT systems and the localization of high-performance

replacement materials.
