The suspended inter-row cultivator is a kind of mechanical equipment used in agricultural production, mainly used for cultivating between the rows of crops. It can be moved by being connected to the tractor, and generally adopts a suspension structure and is hung on the tractor's three-point suspension system. The suspended inter-row cultivator has the advantages of high efficiency, labor saving and precision, which can improve the yield and quality of crops.

The working principle of the suspended inter-row cultivator is to move the tillage cutter back and forth between the crop rows to loosen and loosen the soil, remove weeds and impurities, make the soil more air-permeable and water-permeable, and promote the growth and development of crops. At the same time, intertillage operations can also control the growth and reproduction of weeds, reduce the competition for crops, and thus improve the yield and quality of crops.

The suspended inter-row cultivator has the characteristics of easy operation, convenient construction, and high efficiency. It is widely used in the cultivating operations of various crops, such as corn, soybeans, cotton, wheat, etc., and is one of the important mechanical equipment for modern agricultural production.
