## Abstracts

According to our (Global Info Research) latest study, the global Mouse Primary Cell market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Mouse primary cells are naturally occurring cells isolated directly from mice, which retain the characteristics and functions of the cells present in the intact mouse tissue from which they were derived. These cells are valuable in biological research as they provide a more natural and accurate representation of the in vivo environment compared to cell lines that been cultured for many generations. They are often used for studying disease mechanisms, drug discovery, and toxicology testing. Primary cells can be isolated from various mouse tissues as the liver, heart, brain, and immune system, and can be maintained in culture for limited periods, during which they can be studied and manipulated.

The industry trend for mouse primary is characterized by a growing demand driven by the increased precision and relevance of research in model organisms, particularly in areas such as oncology, immunology, and neuroscience. Advances in cell culture techniques and the development of better reagents and tools for primary cell isolation and maintenance have contributed to this trend. Additionally, the pharmaceutical and biotechnology industries are increasingly recognizing the value of primary cells for drug development and toxicity testing, which is driving the development of more sophisticated and high-throughput screening methods using these cells. This, in turn, is prompting manufacturers to offer a wider range of high-quality primary cell products and associated services.
