Abstracts

Minimal residual disease (MRD) refers to the small number of cancer cells that remain in the body after treatment. The number of remaining cells may be so small that they do not cause any physical signs or symptoms and often cannot even be detected through traditional methods, such as viewing cells under a microscope and/or by tracking abnormal serum proteins in the blood. An MRD positive test result means that residual (remaining) disease was detected. A negative result means that residual disease was not detected. The most widely used tests to measure MRD are flow cytometry, polymerase chain reaction (PCR) and next-generation sequencing (NGS).

According to our (Global Info Research) latest study, the global MRD (Minimal Residual Disease) Testing market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.
