Abstracts

The global MRI Guided Drug Delivery market size is expected to reach \$ 246 million by 2032, rising at a market growth of 10.0% CAGR during the forecast period (2026-2032).

MRI guided drug delivery or magnetic resonance guided drug delivery is a part of an advanced drug delivery system that helps transport a therapeutic agent from the site of administration to the targeted area. High intensity focused ultrasound (HIFU) is a non-invasive and non-ionizing sonic energy-based therapeutic technology for inducing thermal and non-thermal effects in tissues. Depending on the parameters, HIFU can ablate tissues by heating them to $>55\text{ }^{\circ}\text{C}$ to induce denaturation and coagulative necrosis, improve radio- and chemo-sensitizations and local drug delivery from nanoparticles at moderate hyperthermia ($41\text{-}43\text{ }^{\circ}\text{C}$), and mechanically fragment cells using acoustic cavitation (also known as histotripsy). HIFU has already emerged as an attractive modality for treating human & veterinary cancers, infectious diseases, and neuromodulation.

The core global MRI Guided Drug Delivery manufacturers include Chongqing Haifu Medical Technology, Monteris and Medtronic. The top three companies have a market share of about 43%. North America is the world's largest MRI Guided Drug Delivery market with a market share of approximately 57%, followed by China and Europe with a market share of 35% and 4%, respectively. In terms of product type, MRgFUS Non-Invasive Device is the largest segment with approximately 79% market share. In terms of application, Hospitals is the largest downstream segment, accounting for approximately 89% of the market share.
