Abstracts

According to our (Global Info Research) latest study, the global mRNA Delivery System market size was valued at US\$ 1039 million in 2025 and is forecast to a readjusted size of US\$ 1622 million by 2032 with a CAGR of 6.7% during review period.

mRNA has a large molecular weight and strong hydrophilicity, but its single stranded structure makes it extremely unstable and easily degraded. It carries a negative charge and is difficult to deliver through cell membranes with negative charges on the surface. Therefore, special modification or encapsulation delivery systems are required to achieve intracellular expression of mRNA. Delivery technology is the core patented technology of mRNA companies. Lipid nanoparticles (LNP) are currently the mainstream delivery carrier method. Due to its easy absorption by antigen-presenting cells, it is most commonly used in vaccines, and currently the three major mRNA vaccine giants have adopted LNP delivery technology. In addition, there are cationic lipid complexes (LPX), lipid polymer complexes (LPP) Polymer nanoparticles (PNP), inorganic nanoparticles (INP), cationic nanoemulsions (CNE), as well as the GalNac N-acetylgalactosamine technology independently developed by Ruibo Biotechnology, can be used for targeted delivery to the liver.
