Abstracts

Staphylococcus aureus is a bacteria commonly found on nose or skin of healthy people. MRSA i.e., methicillin-resistant staphylococcus aureus, is thus a type of staphylococcus aureus that is resistant to beta-lactam antibiotic called methicillin. MRSA strains do not respond to methicillin treatment. Around 1% of the population carrying staphylococcus aureus on their nose or skin are infected by MRSA. The infection causes skin and tissue infection, and is transmitted by direct skin-to-skin contact.

Scope of the Report:

This report focuses on the MRSA Drugs in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. Methicillin-resistant Staphylococcus aureus (MRSA) is a skin infection that occurs mostly in hospitals and healthcare facilities. It is treated with commonly-used antibiotics and is highly contagious. This infection is difficult to treat because it is sometimes resistant to commonly-used antibiotics such as methicillin. As per this market research report, the aging people are highly susceptible to MRSA infections, especially in the hospital environment as their weak immune system makes them easily prone to diseases and infections.

The worldwide market for MRSA Drugs is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
