According to our (Global Info Research) latest study, the global MT-jumper for Data Center market size was valued at US\$ 543 million in 2025 and is forecast to a readjusted size of US\$ 909 million by 2032 with a CAGR of 7.6% during review period.

Data center MT patch cords (MT-jumper) are multi-core fiber optic patch cords specifically designed for high-speed optical interconnects in data centers. They typically employ MT or MPO structures to achieve parallel transmission of 12, 24, or higher density fibers, used for high-bandwidth connections between servers, switches, and optical modules. They are a crucial foundational component supporting high-speed interconnects within computing centers. In 2025, global sales of data center MT patch cords were approximately 2.4 million kilometers, with an average unit price of approximately US\$220 per kilometer and a capacity utilization rate of approximately 85%. The upstream and downstream companies include fiber optic preform and fiber optic manufacturers, precision connector and ceramic ferrule processing companies, optical module and optical communication equipment manufacturers, and data center infrastructure integrators. The gross profit margin is approximately 30%. In the product cost structure, fiber optic and MT connector components account for approximately 48%, high-precision polishing and assembly for approximately 27%, testing and yield losses for approximately 13%, labor and manufacturing costs for approximately 9%, and other costs for approximately 3%. On the demand side, the downstream demand list includes hyperscale cloud data centers, AI computing centers, enterprise-level data centers, internet content distribution centers, high-performance computing centers, and edge data nodes. The downstream customer list includes cloud computing service providers, internet platform companies, telecommunications operators, data center operators, and system integrators. On the business opportunity side, policy-driven

factors mainly stem from the continued advancement of new infrastructure construction and computing network engineering, driving the upgrade of high-speed optical interconnects. Technological innovation is reflected in the widespread adoption of 800G and 1.6T optical modules, propelling rapid growth in demand for high-density, low-loss MT patch cords. Simultaneously, automated manufacturing and high-precision optical alignment technologies improve yield and consistency. Changes in consumer demand are manifested in the exponential growth of data traffic driven by artificial intelligence and large-scale model applications, significantly increasing user demand for low-latency, high-bandwidth, and high-stability network connections, thus continuously driving the growth in demand for high-end MT patch cords.
