Abstracts

According to our (Global Info Research) latest study, the global Multi-beam Mask Writer market size was valued at USD 665.5 million in 2023 and is forecast to a readjusted size of USD 1026.2 million by 2030 with a CAGR of 6.4% during review period.

Mask writers are devices that use irradiation by electron beams to draw a fine electronic circuit pattern onto a template (the mask), which has been formed by a silica glass substrate with photosensitive resin.

Single-beam mask writers write data to the mask by concentrating the single electron beam on a single position over an electromagnetic field and then deflecting the beam to the position to be irradiated by the polarizer. Large circuit patterns can be created by repeating beam deflection and then moving the stage upon which the substrate is mounted.

Using thousands of tiny beamlets, multi-beam mask writers can pattern or write advanced masks at a faster rate compared to VSB-based tools. With chip miniaturization making device designs more complex and requiring the use of more masks, multibeam systems are coming into demand.

The key manufacturers of multi-beam mask writer in the world include IMS Nanofabrication and NuFlare Technology, of which IMS Nanofabrication holds more than 75% of the market share. The global production of multi-beam mask writers is mainly distributed in North America, Europe, Chinese Mainland, China Taiwan and South Korea, among them, Japan is the largest producer, occupied for a share of more than 30%. In terms of products, the current share of 7nm and above is more than 48%.
