A multi-bellows expansion joint is a type of pipeline compensator consisting of multiple bellows designed to absorb displacements and stresses caused by thermal expansion, contraction, or mechanical vibrations in pipelines. Through the elastic deformation of the bellows, it compensates for axial, lateral, or angular movements, ensuring the safe operation of piping systems. Typically made from high-performance materials such as stainless steel, multi-bellows expansion joints are widely used in industries such as petrochemicals, power generation, heating systems, shipbuilding, and aerospace.
