Abstracts

The global Multi-Channel GNSS Satellite Simulator market size is expected to reach \$ 1190.8 million by 2029, rising at a market growth of 5.6% CAGR during the forecast period (2023-2029).

The satellite signal simulator is a test device for simulating the trajectory of satellite navigation signals. It can carry out real-time simulation according to the real-time satellite frequency signal, and can also realize the simulation of satellite navigation signals in the required navigation environment through manual settings. It is applied to satellite Establish a set of simulation models during the test of motion, atmosphere, vehicle, signal characteristics and other effects, and simulate a set of trajectories identical to those of the satellite receiver on the motion platform environment. The multi-channel satellite signal simulator has three key modules: navigation message production, C/A code generator and carrier production. First, the system generates dynamically changing navigation messages through the dynamic parameters of the navigation messages. The dynamic ranging code is generated through the dynamic parameters of the pseudo code, and the dynamically changing modulated carrier is generated through the carrier Doppler frequency shift parameter, and then the generated navigation message is subjected to spread spectrum modulation and carrier modulation. Finally, after high-speed D/A digital-to-analog conversion, low-pass filter and up-converter, a highly dynamic satellite navigation signal is finally formed.
