A multi-channel passive acoustic recorder is a passive listening device used to acquire and record multiple acoustic signals. It relies on sound wave propagation underwater or in the air for target monitoring, without actively emitting signals. It is widely used in marine monitoring, seismic exploration, military surveillance, and scientific research.

Upstream components mainly include hydrophones and sensor elements, signal acquisition modules, data storage chips, power systems, and pressure-resistant housing materials. Downstream applications cover marine environmental monitoring, seabed resource exploration, military surveillance, scientific research, and ecological protection. The global average price of a multi-channel passive acoustic recorder is US\$71,200 per unit, with sales of approximately 4,556 units and global production capacity of approximately 4,800 units. The industry profit margin is 20%.
