## Abstracts

The global Multi-core High Voltage Connector market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A multi-core high-voltage connector is an electrical device capable of connecting multiple wires in a high-voltage environment. Multi-core high-voltage connectors are usually made of metal or plastic, with good insulation and heat resistance. The structure of a multi-core high-voltage connector generally includes the following parts: Shell: The shell is the outer protective layer of the connector, which is used to prevent damage to the connector by water, dust, corrosion, etc. The shape and size of the housing vary depending on the type and use of the connector, such as round, square, rectangular, etc. Plug: The plug is the main part of the connector and is used to insert the wire into the corresponding socket. The shape and size of the plug also vary according to the type and use of the connector, such as pin type, fork type, slot type, etc. Receptacle: The receptacle is the other part of the connector that receives the wires from the plug. The shape and size of the socket matches the plug to ensure a secure connection of the wires. Outlets usually have a locking mechanism that prevents the plug from falling out under high voltage. Seal: The seal is an auxiliary part of the connector, which is used to enhance the sealing performance of the connector. Seals, usually made of rubber or silicone, can be filled between the housing and plug or between the plug and receptacle to prevent air, water, or other substances from getting inside the connector. The application fields of multi-core high-voltage connectors are very wide, such as electric power, communication, automobile, medical treatment, industry and so on. Multi-core high-voltage connectors can provide stable and secure electrical connections while saving space and cost.
