Abstracts

The global Multi-Mode Radar market size is expected to reach $ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The advancement of radar technology including availability of low-cost electronic scanning antennas,

high capability and easily programmable signal processing platforms, and high-quality digital waveform

generators, allows modern radars to do so much more than their predecessors. Yet, the majority of

radars on the market presently offer only single mode operation or attempt to apply modes for one

application directly to another application despite differences in target type and radar environments.

However, there are radars now becoming available that offer the operation of all three modes, for air,

ground and water, simultaneously. These multi-mode radars were once only available in multi-million pound military systems, but are now available at a fraction of these costs.

The majority of radars on the market at present offer only a single mode of operation or apply the mode for one application directly to another application despite mismatches in

target type and radar environments. However, radars are now becoming available that offer the operation of all three modes simultaneously and these multi-mode radars enable optimal performance in each of the three domains in which they operate: air, ground and water. The multi-mode radar needs to be able to handle simultaneously the complex operational needs of each unique environment.

Multi-mode radars offer traditional radar capabilities while at the same time allowing extended capabilities including drone, covert boat and crawler detection. The radar can apply its different modes depending on where it is looking. Radar beams pointing upwards will use air modes. This allows optimised drone detection, without significant ground clutter management. Radar beams pointing horizontally or even downwards will use ground or coastal modes. This allows surface clutter to be optimally filtered while still being able to detect drones. The switch between ground and coastal modes can be made automatically based on geographics inputs from a regional coastline map.
